

My grand plan is to become the best full-stack developer in my field. I have worked as a full-stack developer, and I have some amount of knowledge in developing. I have taken this course to gain more knowledge and do more research on full-stack development. During this course period, I must learn front-end, back-end, database and hosting. Currently, I don't have much knowledge of hosting.

By working in an IT company, I gain some knowledge, but my ambition is to create a website from scratch and do the hosting. Previously I was updating the existing web applications. Now I am looking to learn every point in creating a website. Nowadays we have many platforms that provide website templates and help to host it in their domain, but I want to create a website by coding and hosting it in any cloud platform.

I have researched various IT-related professions, and I found my suitable profession as a full-stack web developer. It gives me more satisfaction and interest to learn new things when I am developing a web application. Nowadays, everyone needs a webpage or application for day-to-day life. My aim is to create a web application or app that is useful to everyone. Also, I want to work as a freelance developer.
